

Abstract of the Disclosure

The present invention relates to a method for reception and processing of incoming calls and messaging services in a mobile communication terminal based on relevant conditions wherein the priority and time condition are set in each caller identification (CID) so that an incoming call, Short Message Service (SMS) or Multi-media Message Service (MMS) may be accepted or rejected according to the relevant conditions.

Also, provided is a method for reception and processing of incoming calls and messaging services in a mobile communication terminal wherein the priority and time condition are set for each CID so that an incoming call, SMS or MMS received at a specific time point may be processed to be selectively accepted or rejected according to the preset priority or time condition for the incoming call, SMS or MMS and that different reception procedures may be performed even for the same CID according to the relevant priority and time conditions.
